RESEARCH AND CREATIVE ACTIVITIES

The overall focus of my research is on practical interventions to aid management of chronic disease in vulnerable populations. Early work centered on patients with complicated regimens, such as AIDS, end-stage renal disease and COPD. My doctoral study involved an in-depth look at adherence behavior, specifically medication adherence in patients with asthma. Although some of my research still involves testing interventions to improve adherence behavior (TB adherence in adolescents, homeless persons), I expanded my initial interest in asthma to allergies and the environment in a vulnerable population of high-risk urban Mexican American families with children with asthma. In addition, I have collaborated on projects related to childhood obesity and diabetes and other community based research topics. One of my goals is to develop and evaluate culturally sensitive and practical interventions to improve health promotion and management of disease in underserved populations. A more recent interest is health promotion consultation in a community setting.
